Short questions (45 points)

Q1. 7.5 points
Q2. 7.5 points
Q3. 7.5 points
Q4. 7.5 points
Q5. 7.5 points
Q6. 7.5 points

Applied problems (60 points)

Q7. 10 points
Q8. 10 points
Q9. 10 points
Q10. 10 points
Q11. 10 points
Q12. 10 points

Good luck!

Question 1 (7.5 points)

Explain the concepts of point forecast, interval forecast, density forecast.

Question 2 (7.5 points)

Explain what loss function is.

Question 3 (7.5 points)

Give two examples of loss function, one symmetric, one asymmetric. Draw their graphs.

Question 4 (7.5 points)

Consider Fed forecasting inflation. Is it likely to have (1) a symmetric loss function, or (2) an asymmetric loss function with larger losses for negative forecast errors, or (3) an asymmetric loss function with larger losses for positive forecast errors? Explain.

Question 5 (7.5 points)

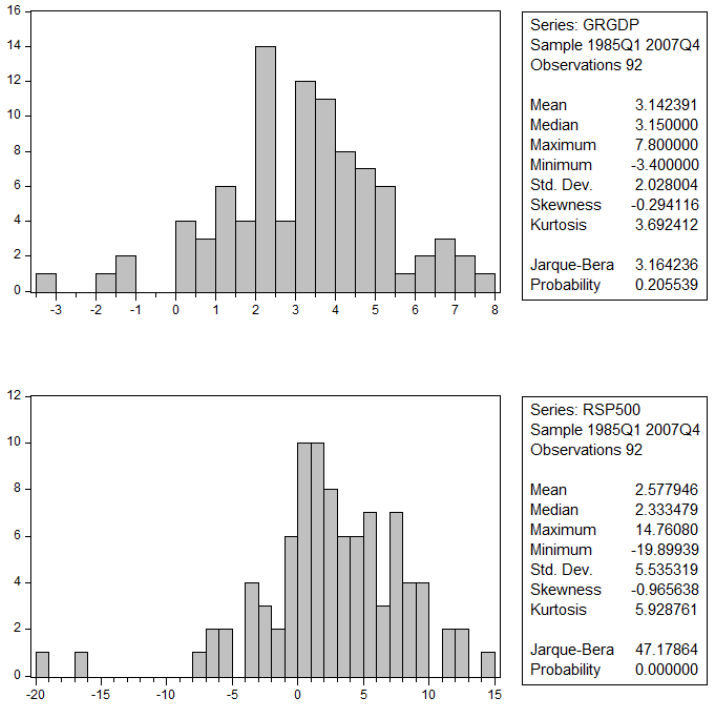
Define an AR(1) model (write its equation) and describe how its AC and PAC functions look like.

Question 6 (7.5 points)

Define an MA(2) model (write its equation) and describe how its AC and PAC functions look like.

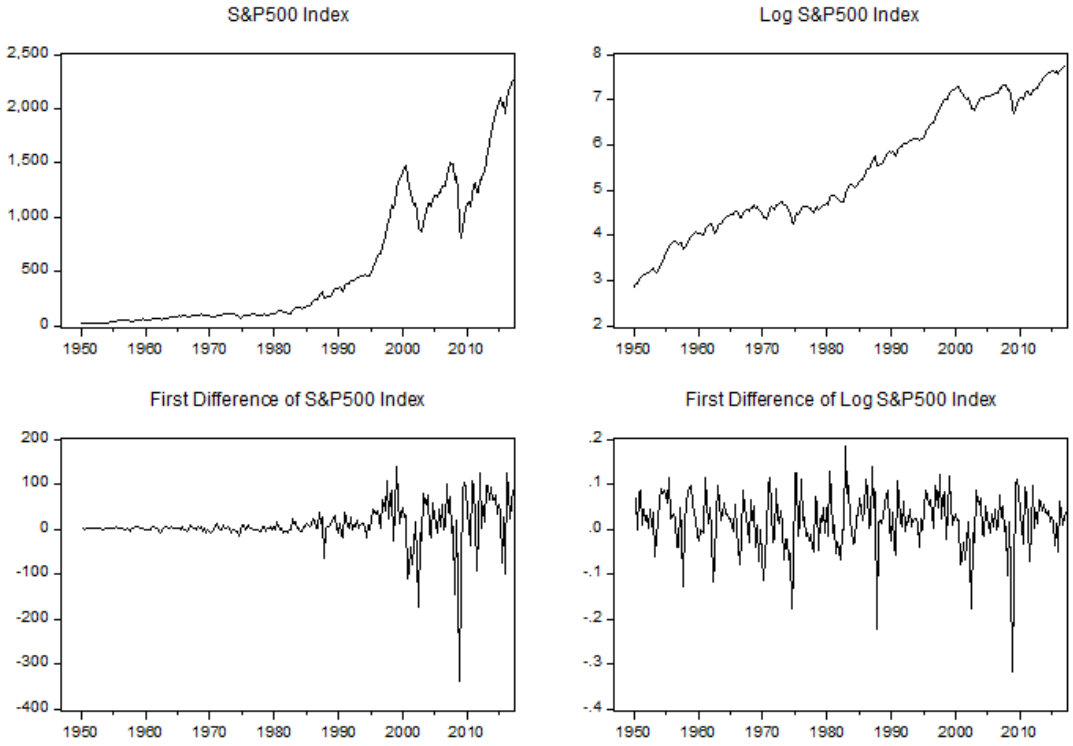
Question 7 (10 points)

Figure below shows the histograms for the real GDP growth rate and the quarterly return for S&P500 Index during the period 1985Q1-2007Q4. Is the GDP growth rate normally distributed in this sample? How about the returns for S&P500 Index?



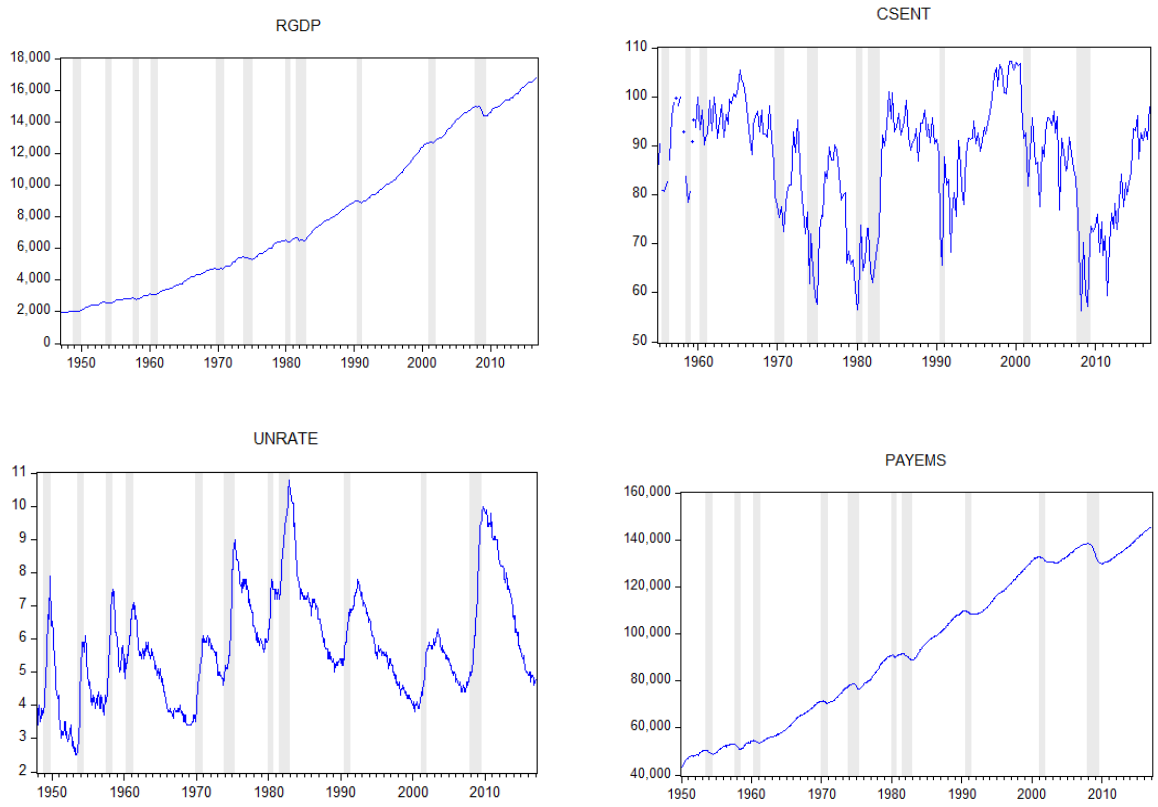
Question 8 (10 points)

Figure below shows the time series for the S&P500 Index, the log transformed S&P500 Index, and also their first differences. Explain which of the four series are nonstationary, first order weakly stationary, second order weakly stationary.



Question 9 (10 points)

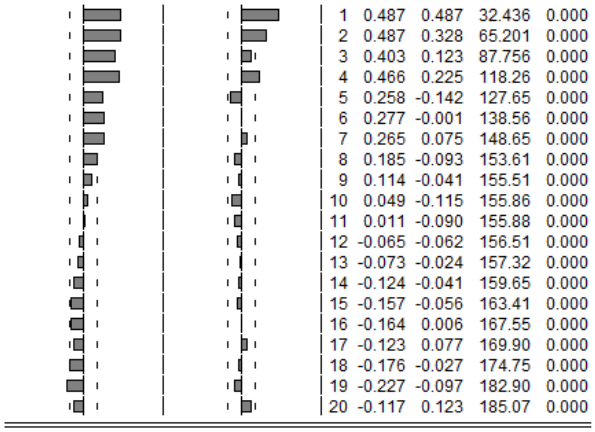
Figure below shows the time series for U.S. real GDP., `RGDP`, Index of Consumer Sentiment `CSENT`, U.S. unemployment rate. `UNRATE` and Employment (Total Nonfarm Payrolls) `PAYEMS`. Explain which of the four series are nonstationary, first order weakly stationary, second order weakly stationary.



Question 10 (10 points)

Figure below show the correlogram for the percentage change in the house price index in San Diego MSA during 1975Q1-2008Q3. Discuss which AR/MA/ARMA models would you consider as plausible candidates for this time series and explain why.

Date: 02/25/17 Time: 13:30
Sample: 1975Q1 2008Q3
Included observations: 134



Autocorrelation	Partial Correlation		AC	PAC	Q-Stat	Prob
		1	0.487	0.487	32.436	0.000

Question 11 (10 points)

Figure below shows the correlogram for the residuals from AR(2) and AR(4) models for the percentage change in the house price index in San Diego MSA. For a good model, the residuals should be white noise with no time dependence. Do the residuals from AR(2) and AR(4) model satisfy this property? Explain why yes or why no.

Date: 02/25/17 Time: 13:32
Sample: 1975Q1 2008Q3
Included observations: 134
residuals from AR(2) model

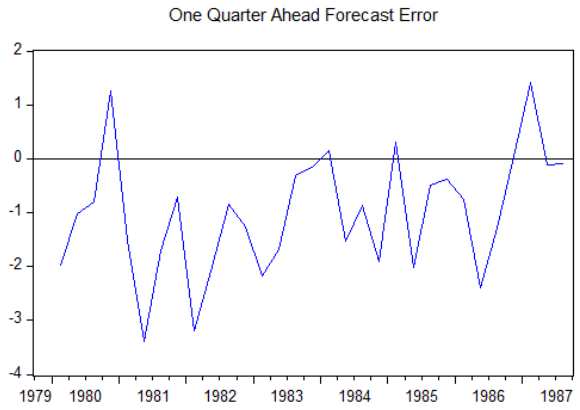
Question 12 (10 points)

Consider the one quarter ahead Fed's forecast for inflation during the 1979Q4-1987Q3 period.

Suppose that we want to test whether the Fed's forecast are optimal under the symmetric quadratic loss function, which would imply that $E(y_{t+1}) = f_{t,1}$ and thus the forecast error $e_{t,1} = y_{t+1} - f_{t,1}$ would have to satify $E(e_{t,1}) = 0$, and in the regression $e_{t,1} = \beta_0 + e_t$ coefficient β_0 should be zero. Figure below shows that time series plot for the forecast errors, and the results of that regression.

Interpret these results; what can we say about Fed's loss function during 1979Q4-1987Q3 based on them?



Dependent Variable: GPGDP_E1
Method: Least Squares
Date: 02/24/17 Time: 19:34
Sample (adjusted): 1980Q1 1987Q3
